

IDEAS To Be Worked Upon

- (1) I have used the word **"Deleting" or "Delete"** in place of **"cancelling" or "cancel"**. This can be completed easily.
- (2) There should be **different accounts for different users**. And hence there should be options to Sign Up or Login.
- (3) User's **booking history should be stored** by the virtue of their accounts.
- (4) When User Logs In we can **display all the bookings of the user**.
- (5) When User may click on one of the tickets, it should show the complete booking details and at the bottom there should be an **option to cancel** the ticket.
- (6) In the current stage of the app, only one person can **book the ticket** at a time so this can be extended **up to 4 passengers**.
- (7) When the app launches, it takes us to "Enter the Password of Admin", instead of this we can launch the app to **give a choice to user that he wants to enter user's portal or admin portal**. On entering user's portal, it can be asked to sign in or sign up or enter a guest session. On entering admin portal, it should ask for login password.
- (8) There can be options of **forgot password** also. It is possible that we can make a database, or a **random generated OTP** type of system and OTP can be **sent via registered emails** (which we already have in Firebase Firestore).
- (9) To improve overall user interface, we can **play around with some colors**.
- (10) The user interface needs a lot of improvements which are as follows **(IMPORTANT)**: -
 - a. When is asked to enter some information, what all should he enter it should be given in a well-defined way e.g. in what formats do they have to enter the information what all should they enter...
 - b. When we are asking for entering the gender, we can give them a drop-down menu instead of asking to enter the data.
 - c. Back button must be removed as it may take us to previous "Activities" which may be confusing for the user.
 - d. In case of guest session, we must display an option of cancel the ticket when user is getting an existing ticket.
 - e. When we are selecting a flight instead of asking for serial number, we can give our users, some buttons to login or may provide a drop-down menu and ask user to choose the desired option.
 - f. If a user enters some wrong details, we must display what all credentials he has wrongly input instead of displaying message "Enter Details Correctly".
 - g. Admin should be able to add a flight with same details on different days and there should be a "calendar button input" for him.
